REMARKS

STATEMENT OF THE SUBSTANCE OF THE INTERVIEW

The interview primarily focused on the teaching of Ohyama et al. (USPN 5,680,484) as compared to claim 1. A comparison of Ohyama with the present invention was presented by Mr. Fauver and Mr. Leone noting that the present invention uses pseudo-projection methods that employ imaging optics to provide an image such that the depth of field is at least as large as the region of interest of the specimen. The present invention involves extending the depth of field by mechanically scanning the focal plane in a continuous manner, and integrating the images onto a detector during a single exposure. In contrast, Ohyama does not use pseudo-projection methods, but simply assembles discrete focal-plane scans into a 3D image with additional sampling errors from reconstructing from a set of projections. Examiner Long Le requested more explanation of the term "pseudo-projection" be added to the response when filed.

Respectfully Submitted,
